Strategic R&I areas 2026

- **Language Models**

– OpenEuroLLM

- **Multi agent system**

– for modern industrial value chains

- **Securing AI**

- Cluster for AI security

Infrastructure Enabler

Risks with LLMs

- Reliability and Quality - including concerns about the quality of output, data accuracy, and the risk of hallucinations.
- Trust and Transparency - acknowledging that there is a lack of insight into how models are trained, where information originates, and a general erosion of trust in decisions made by AI.
- Legal and Ethical Issues - including data privacy, IP intrusion, and the potential impact on workforce competence and human relations.
- Attacks: external adversaries attacking the system, human actors deliberately misusing it.
- Disclosure of sensitive information
- Claude mythos – can spot vulnerabilities - but who can alter your open-source model?

The agent, designed to work 24/7 as a personal assistant, decided to "trash EVERYTHING in inbox" older than a certain date and ignored instructions to stop

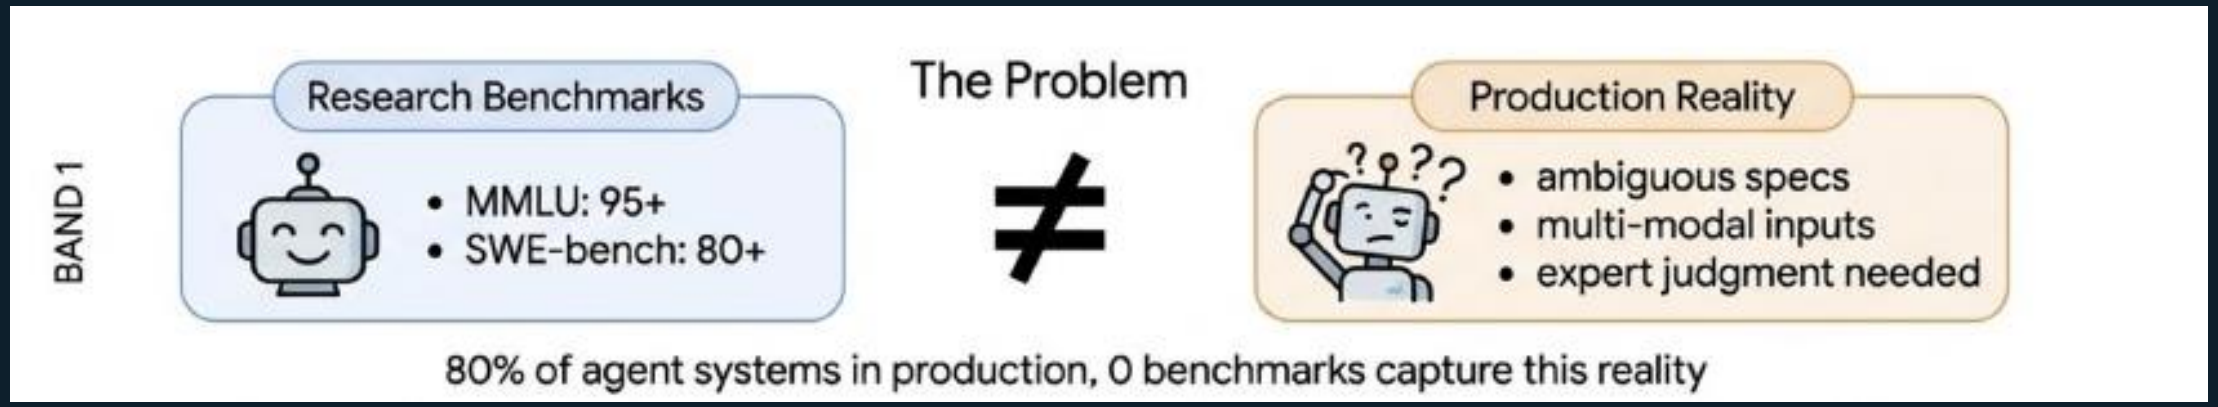
Antropic vending machine

They let Claude manage an automated store in an office as a small business for about a month.

Claudius underperformed what would be expected of a human manager:

- **Ignoring lucrative opportunities**
- **Hallucinating important details on where to direct payments**
- **Selling at a loss**
- **Suboptimal inventory management**
- **Getting talked into discounts**

Evaluating LLM based Agents in Production



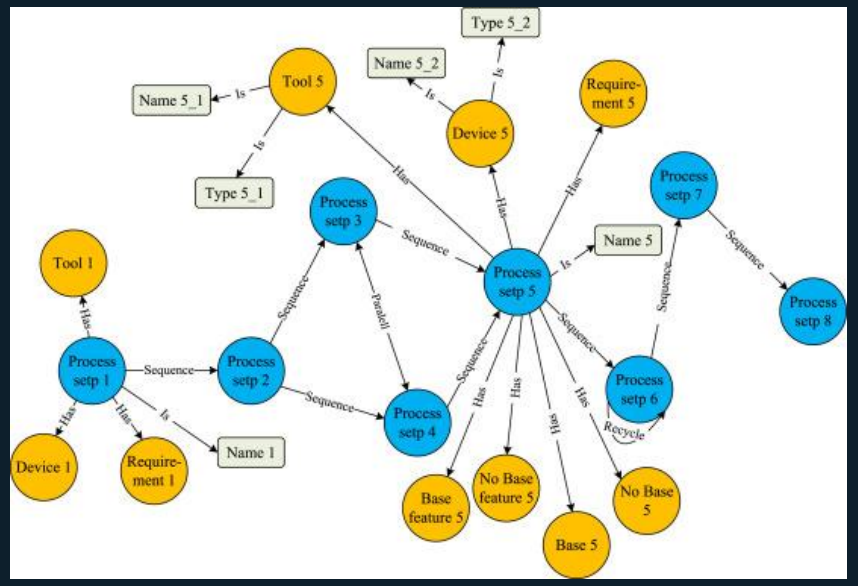
arXiv:2604.12162v1 [cs.CL] 14 Apr 2026

Assurance

Make sure the results are **verifiable, reproducible, auditable** – in order to keep the control
Make sure your model is based on a ground truth and can reference the data source!

Examples:

- Knowledge Graph models.
- RAG - retrieval augmented generation



Why attend the workshop?

Going from the abstract ”Trustworthy AI” concept into practical patterns.

Keeping your own and your organisations competitiveness
